Manage External Websites

Domain Management can submit categories and allow management of DNS records for websites with content setup externally, independant of Domain Manager.

DNS Records

Here are the steps for users interested in having DNS records controlled Domain Management

1. Once the user is logged in, click on `Domains`

2. Click `Create Domain` button in the top right

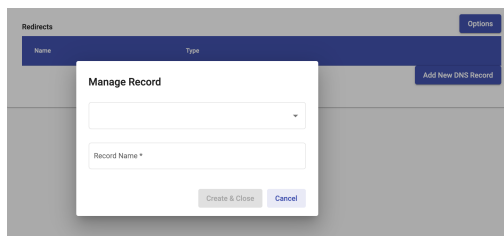

3. Once your domain has been created, click on your domain and then click the `Hosted Zone` tab

   - You'll find four nameservers (NS) similar to the ones highlighted in the picture above.
   - Copy these nameservers, without the `.` period at the end of each line, and paste them into your registrar under your purchased domain.

4. The user can now manage DNS records for the domain under the `DNS Records` tab

Categorization

Currently, a user can have external sites submitted for categorization and categories checked using the CLI interface application. Please refer to the Command Line section of this documentation for more information.

```
(.venv) ➜ script git:(develop) python src external
Usage: src external [OPTIONS] COMMAND [ARGS]...

  Manage categorization of external websites.

Options:
  -h, --help  Show this message and exit.

Commands:
  categorize  Categorize an unmanaged website.
  check       Check category on an unmanaged website.
```

When the CLI application is setup and ready to go, you can run the following commands:

- Submit an external website for categorization

  - `python src external categorize -d <domain-name>`

- Check an external website's categorization

  - `python src external check -d <domain-name>`
